New Approaches to Chemical Risk Assessment for Foods & Food Ingredients Task Force

About the Task Force

New tools in the assessment of toxicity focus on developing a better mechanistic understanding of the biological interactions and pathways involved, through the application of cellular and molecular based methods, combined with computational approaches. These methods are designed to measure biological perturbations, rather than toxicity per se. Hence, some changes may reflect desirable effects whilst others may reflect untoward effects, depending on the concentration of the chemical present. This is particularly important when considering food. Hence, this task force is investigating how these new approaches can be applied in risk assessments that are relevant to the development of safe foods and food ingredients.

WHAT'S NEW?

EVENT
The task force plans to have a workshop in early 2019 on Adverse Outcome Pathways and their potential application in risk assessments.

WEBINAR
The task force will organise a webinar on their ToxCast activity in 2018.

ACTIVITIES

Application of Adverse Outcome Pathways (AOPs) for Foods and Food Ingredients in Risk Assessment

The activity aims to:

- understand the coverage of existing AOPs for foods and/or food ingredients; and
- identify the necessary additional information required to enable AOPs to be implemented for quantitative risk assessment and regulatory use to support the shift from animal testing to non-animal approaches in food safety risk assessment.

The outcome of the activity is expected to provide guidance for industry and risk assessors in the food sector to maximise the utilisation of emerging toxicological science that is more human relevant and less animal dependent.

New Approaches to Chemical Risk Assessment for Foods & Food Ingredients Task Force

Member Companies

- BASF SE
- Danone
- DSM
- Firmenich
- Mars-Wrigley Confectionary
- Mayr-Melnhof Karton
- Mondelēz International
- Nestlé
- Unilever

Activities

Exploitation of ToxCast Data on Food Chemicals for Safety Risk Assessment

A high throughput screening programme of chemicals for potential toxicity (ToxCast) was performed by the Environmental Protection Agency (EPA). The ToxCast Expert Group aims to exploit the data relevant to the food industry from the ToxCast programme and assess the utility of the data and methods for their use in the safety risk assessment of food chemicals.

This activity will draw conclusions from the chemical structure of food-relevant compounds to assess their safety for human consumption and handling. An Adverse Outcome Pathway (AOP) may be developed based on these conclusions and the possibility of read-across will be assessed.
