

ABOUT THE TASK FORCE

A well-functioning immune system is essential for human health and wellbeing. Nutrition plays a major role in shaping and optimising immune functions.

This task force focuses on better understanding the impact of nutrition on immune functions and on determining reliable markers of immuno-modulation and inflammation, relevant to health and wellbeing. In the context of health claims regulation, the task force provides guidance for the design, assessment and interpretation of nutritional intervention studies that intend to modulate immune functions.

WHAT'S NEW?

LATEST PUBLICATIONS

Calder *et al.* **Health Relevance of The Modification of Low Grade Inflammation in Ageing (Inflammageing) And The Role of Nutrition.** In this review the experts documented evidence for the protective role of diets and foods as a strategy to boost healthy ageing.

EVENTS

Results from Calder *et al.*, 2017 were presented at the 12th European Nutrition Conference Federation of European Nutrition Societies (FENS) 2015 and at the Biology of Ageing Conference 2015. Conclusions from Calder *et al.*, 2013 on biomarkers of inflammation were presented at BENEFIQ 2016.

ACTIVITIES

Relevance of quality of life measures to assess effectiveness of nutrition on common infections – **UPCOMING ACTIVITY**

The objective of this activity will be to investigate the relevance of the quality of life tools available (generic and health-related QoL) and to provide an expert opinion on the usefulness of this measure as an indicator marker (proxy) of health in the context of rather acute infection conditions,

gastrointestinal and respiratory infections. The activity will be split into two subactivities. Activity A should focus on infant/children (overall <5yrs old) and activity B will review the available QoL instruments developed for elderly people (65+ yrs old).

Immune Competence Across Lifespan: Impact of Nutrition on Immune Competence and Its Consequences Later in Life

The critical nutrients supporting immune development and competence in the first years of life as well as the impact of early life nutrition on later life immune competence are still under debate. Building on the examination of relevant signalling pathways, this activity is intended to identify and explore markers representing the interaction between nutrition and immune competence.

Subsequently, the influence of early life nutrition on health later in life will be evaluated. The output of this activity will provide a recommendation on readouts for immune competence and nutritional recommendations for an optimal performing immune system early in life. It will further draw associations between early life nutrition and immune competence later in life.

ACTIVITIES (CTD)

Health Relevance of the Modification of Low-Grade Inflammation (LGI) in Ageing: Causes, Effects and Health & Wellbeing Consequences of LGI – **COMPLETED**

Low-grade inflammation (LGI) has been linked to several chronic adverse health conditions including obesity, metabolic syndrome and cardiovascular diseases. It also occurs as a natural consequence of ageing. The aim of this project is to clarify if a modification in LGI could

have a beneficial effect. The review highlights the health relevance of modifying LGI in terms of well-being and health. The experts focused more on the modifiers (such as nutrition and life style factors) than on the triggers. The review addresses the cross-talk between the gut and the brain.
